

## **EPSC**Webinar

Wednesday 16<sup>th</sup> June 2021 15:00 - 16:00 (CEST) 14:00 - 15:00 (BST)

EPSC webinars facilitated by knowledgeable solution providers offer the opportunity to learn and discuss on a specific safety topic.

## Click <u>here</u> to register

## Visualize and manage process safety risk in operations: practical case studies

Despite mature approaches to process safety management throughout asset lifecycle, major accidents still occur. The EPSC research for *Process Safety*Fundamentals identifies the heart of the problem; how facilities are operated and maintained is critical to sustain process safety barriers.

This workshop shares two practical case studies of Operational Risk Management
Digital Twin implementations that connect process safety to the frontline. These
implementations provided barrier-based visualizations and management tools to
deliver insight on how planned work activities and critical equipment status impacts
process safety risk.

## Aspects to be discussed in an interactive setting

- Are our facilities getting any safer; where should we focus for improvements?
- The role of digital twin technology in managing operational risk
- Explore data sources and underpinning barrier models for constructing an Operational Risk Management digital twin
- Two practical case studies using barrier-based models to surface systemic risk
- A maturity model to help explore the next steps for your digital twin journey
