Detect Pipeline Leaks Early and React Immediately and Safely

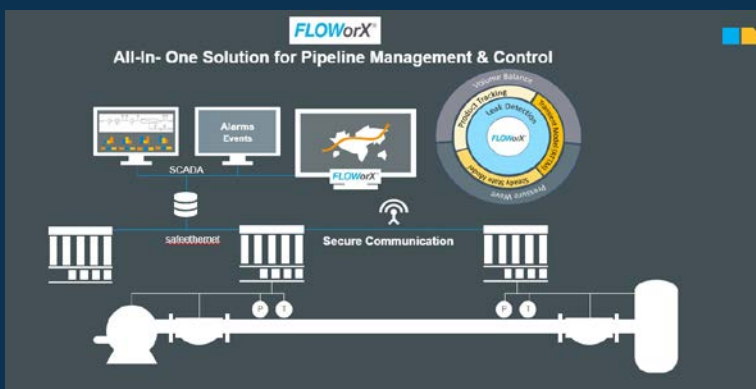

Each year, there are more than 2,000 incidents in European pipelines. Resulting in financial losses and environmental- and reputational damage.

Due to low operator confidence in common leak detection systems, unnecessary risks are taken, by delaying action when an alarm is raised.

An integrated system for safety and critical control, that detects even small leaks and precisely locates them, safeguards against this. Enabling you to consistently control your gas or liquid pipelines. Stop leaking money and learn more about HIMA's PMC application.

Aspects to be discussed in an interactive setting

- Common incidents in pipelines
- Different methodologies available for leak detection
- FLOWorX application and integrated system explained
- SIL approved leak detection: development partners/projects
